# 1 PIP Installation

If your computer doesn't have pip installed, dependant on your operating system, do the following:

## 1.1 Windows

(This is a pain, so you'll probably just want to get a TA to do it for you to save time)

1. Download https://bootstrap.pypa.io/get-pip.py as get-pip.py and then run it using python in the command line.
2. Open a command prompt window as administrator (using the ctrl+shift+enter shortcut)
3. Try and run "easy_install pip" - This will likely not work
4. Enter the directory containing the file via the "cd" command in the command prompt
5. Run the file using "python get-pip.py"
6. Add the folder containing the pip scripts (usually "C:\Python27\Scripts") to your PATH enviroment - this is a mild pain

 Hopefully you're done!

## 1.2 Linux/Mac

1. run "sudo easy_install pip" from the terminal
2. If that didn't work, try "sudo python -m ensurepip"
3. If that didn't work, shout at a TA (preferably Luke)
